EXPERIENCE

AI/ML Software Engineer | CSC Global, San Diego, CA — Jul 2025 – Present

- One of 2 engineers on a greenfield global obligation and risk management product, demoed to 10 prospective customers
- Designed an LLM-based architecture that lets users build persistent dashboard widgets by describing the transformations and visualizations they want in natural language, built to cut a custom dashboard's turnaround from ∼3 days to minutes
- Kept the dashboard feature's LLM costs down by splitting the work across models: a stronger model parses the user's request, and a cheaper one iterates to generate a polished UI
- Identified that the weeks-long enterprise onboarding process used for Fortune 1000 clients shut out small- and mid-cap companies, then designed and built a self-service model to get them set up in minutes
- Built a NetSuite integration that sends self-service sign-ups to finance, using M2M OAuth and including entity resolution against existing NetSuite records
- Implemented authentication and tenant isolation for confidential client data under CSC's regulatory obligations, using per-tenant keys and audit logging
- Built the product's MCP and REST interfaces on Next.js and .NET, with infrastructure on Azure and Temporal, and set up automated issue alerting in Azure Application Insights

Founding Engineer | Terrascope, New York, NY (Remote) — Oct 2023 – Nov 2024

- On a team of 3, co-designed the product for 2 state government contracts, using satellite imagery to replace on-site visits and manual review in property tax assessment
- Engineered the ML inference pipeline, including time-series analysis, for satellite imagery across 13 counties (∼98,000 km^2), built as containerized, queue-driven Python workers for preprocessing, inference, and post-processing
- Set up monitoring and alerting for the workers, surfacing failed jobs for the team to fix
- Built the web app's satellite map views, job dashboards, and authenticated API, plus the company website

Software Engineering Intern | Shield AI, San Diego, CA — Jun 2024 – Aug 2024

- Designed a search algorithm for a pan-tilt-zoom EO/IR payload that sweeps a track's entire covariance instead of aiming at its center, which could cover most or none of the covariance at the resolution detection algorithms require
- Implemented the algorithm in C++ and validated it with SIL and HIL testing

SELECTED WORK

AI Route Planner for Cycling and Running — TypeScript, Cloudflare, MapLibre

- Built a planner that turns a natural-language description into a route using A* search over a graph created from road data
- Added a chat interface, Strava sync, and post-ride road annotation, which lets riders mark roads they liked or want to avoid so future routes follow those notes

AI Tutoring App for Education — Next.js, LangGraph, Supabase

- Built a document ingestion pipeline that turns an instructor's course documents into text, using a vision LLM for visuals
- Grounded the agentic tutor chat and quiz generation in course material with RAG
- Scoped and prioritized features directly with a non-technical client; the app reached 1,800+ unique users, and the client returned for a second engagement

License Plate Recognition for Parking Enforcement — React, Supabase, OpenALPR

- Led development of a system that reads plates from camera feeds, streams them live over WebSockets, and checks each one against active parking sessions
- Ran business outreach to validate demand, found weak-to-nonexistent market signals, and decided not to pursue it further

LEADERSHIP

President | UC San Diego Cycling Team — Jun 2023 – Jun 2025

- Launched an annual race drawing 120+ unique racers, coordinating with the City of San Diego, university administration, USA Cycling, and local businesses

EDUCATION

M.S., Electrical Engineering | Machine Learning & Data Science, UC San Diego — Jun 2025

B.S., Electrical Engineering | Machine Learning & Controls, UC San Diego — Jun 2024

SKILLS

Languages	TypeScript, Python, C++, C#/.NET, SQL
Tools	Next.js, React, LangGraph, MCP, Supabase, PyTorch, Azure, Temporal, Cloudflare, Postgres, Docker, Kubernetes
Other	Spanish & French (conversational); BMW engine builds (turbo E46, V8-swapped E36)
